

## Saudi unemployment rate decreases to 11.3% in Q2/2021

According to estimates of the General Authority for Statistics (GASTAT) based on the Labor Force Survey, the unemployment rate of the total working age population (Saudis and non-Saudis 15 years and above) decreased to 6.6% in the second quarter of 2021, compared to 9.0% during the second quarter of 2020. Moreover, the unemployment rate of total Saudis (males and females 15 years and above), decreased to 11.3% in the second quarter of 2021, compared to 11.7% during the first quarter of 2021. Saudis' total unemployment rate is 4.2 pp lower than in the same period of the previous year, below its pre-COVID level.

### Labor Force Participation rate of total female population increases to 33.8%

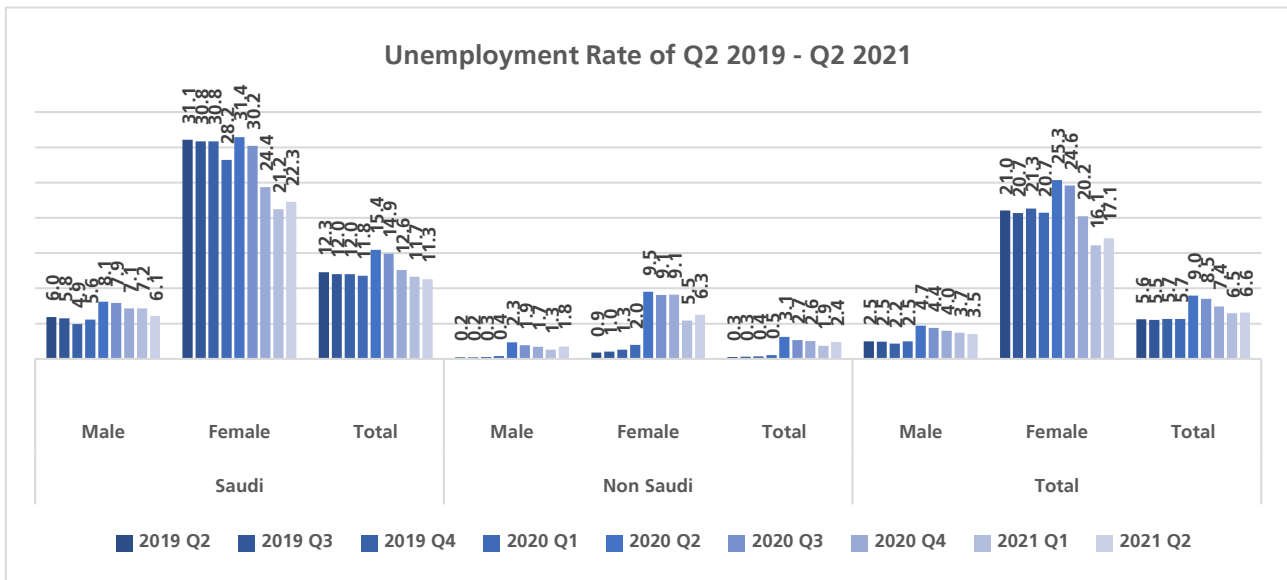

- The unemployment rate of total male working age population in Saudi Arabia decreased in the second quarter of 2021 to 3.5%, compared to 3.7% in the first quarter of 2021. The unemployment rate of total female working age population reached 17.1% in the second quarter of 2021, compared to 16.1% in the first quarter of 2021.
- The unemployment rate of Saudi males decreased to 6.1% in the second quarter of 2021, compared to 7.2% in the first quarter of 2021, while the unemployment rate of Saudi females reached 22.3% during the second quarter of 2021, compared to 21.2% in the previous quarter, based on the estimates of the Labor Force Survey. In the second quarter of 2021, the overall Saudi unemployment rate decreased to 11.3%, compared to 11.7% in the first quarter of 2021, reaching the lowest level during the last ten years.
- The results of the survey also showed that the labor force participation rate of the total working age population (Saudis and non-Saudis 15 years and above) reached 60.8% during the second quarter of 2021, compared to 61.1% in the first quarter of 2021. Furthermore, the results indicated a decrease in the labor force participation rate of the total male working age population in the second quarter of 2021, to reach 79.2%, compared to 79.7% in the first quarter of 2021. The labor force participation rate of the total female working age population increased during the second quarter of 2021 to reach 33.8%, compared to 33.6% in the first quarter of 2021.

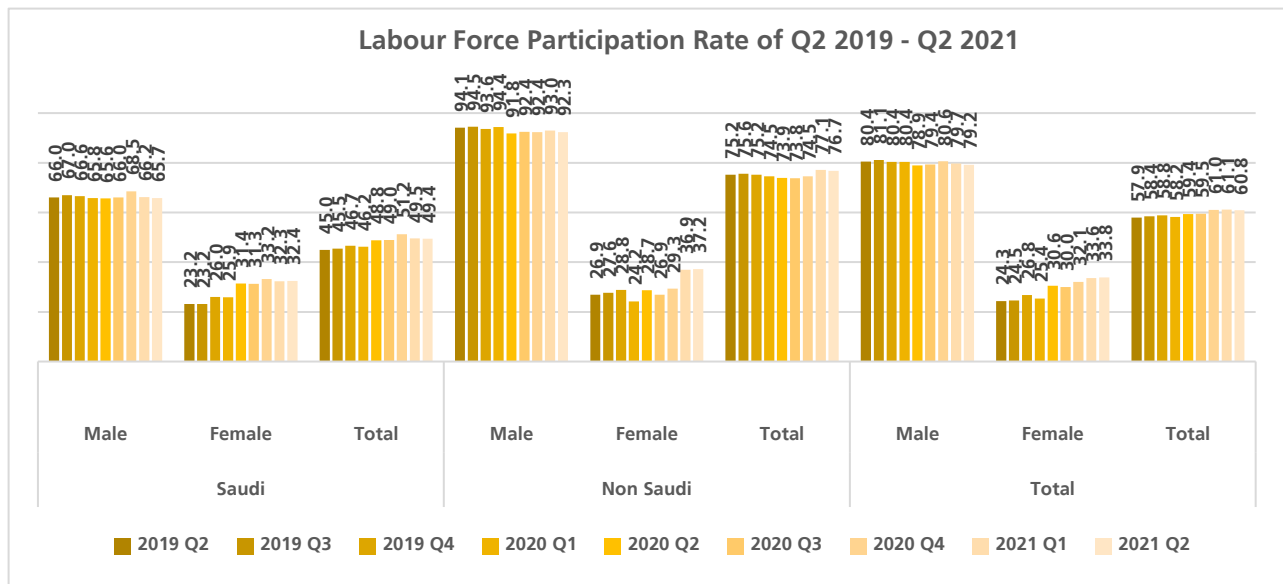

- The results also showed a decrease in the labor force participation rate of Saudis (males and females 15 years and above), to reach a level of 49.4% in the second quarter of 2021, compared to 49.5% in the previous quarter, but remains above the pre-pandemic level.
- The labor force participation rate of Saudi males decreased by 0.4 pp to 65.7% in the second quarter of 2021, compared to 66.2% in the first quarter of 2021.
- The labor force participation rate among Saudi females increased to 32.4% in the second quarter of 2021, compared to 32.3% in the first quarter of 2021.

### Limited mobility of Saudi unemployed

Since the fourth quarter of 2020, the General Authority for Statistics has taken a closer look at the group of Saudi unemployed in order to inform policy makers and the general public, and to produce additional labor market indicators for Saudi Arabia. Asked, whether Saudi unemployed would also accept a job in the private sector, more than 94% answered “yes”. However, many Saudi unemployed would not consider a job offer, which comes with long commuting times. 78.3% of Saudi unemployed females and 48.5% of Saudi unemployed males would only accept a commuting time of one hour or less if they were offered a job in the private sector. Also, 29.3% of Saudi unemployed females and 9.4% of Saudi unemployed males indicated that they would only accept six working hours or less per day.

## Methodology

Labor market statistics are based on two main sources:

\* **First Source:** Labor Force Survey (LFS), (General Authority for Statistics)

The Labor Force Survey is a sample household survey that is conducted by GASTAT. LFS estimates are based on a sample and are therefore subject to response rate variability. All face-to-face interviews have been replaced by telephone interviews since Q2/2020 to protect the health of both interviewers and respondents. Information is collected by calling an updated sample of 53,360 households over phone. The survey provides estimates of the population inside and outside the labor force. It also provides the most important indicators of the labor market, such as the unemployment rate and the labor force participation rate.

- **Unemployment rate:** ratio of unemployed people to the labor force (employed and unemployed) at working-age population (15+ years)
- **Labor Force Participation rate:** ratio of the labor force (employed and unemployed) to the working-age population (15 + years).
- **Unemployed:** Individuals (+15 years) who were:
  1. without a job in the week preceding the interview.
  2. Seriously looking for 7 days during the four weeks preceding the interview.
  3. People who are available to work and start a job in the week preceding the interview or the next two weeks.
- In addition to applying the standards of the International Labor Organization in calculating the unemployment rate, GASTAT uses the standards of the Labor Market Policies Committee in calculating the unemployment rate by cross-validating LFS information against administrative records.

\* **Second Source:** Administrative data (GOSI, MHRSD, NIC) recorded and updated by government agencies related to the labor market, as these agencies are major sources of data of employed.
